Celloras

What are these cells?

Ask. Inspect the evidence.
Keep your decisions.

An agent for plant researchers,
starting with soybean.

celloras.com

A cell label is a research decision.

A map shows groups. Naming them needs evidence and judgment.

01	**Compare the genes**	Which genes distinguish this group from the rest?
02	**Check the references**	Does the published evidence fit this plant and tissue?
03	**Keep the reasoning**	What did we decide, why, and what still needs checking?

Investigate in one conversation.

1 **Ask**

Run analysis through the agent.

2 **Inspect**

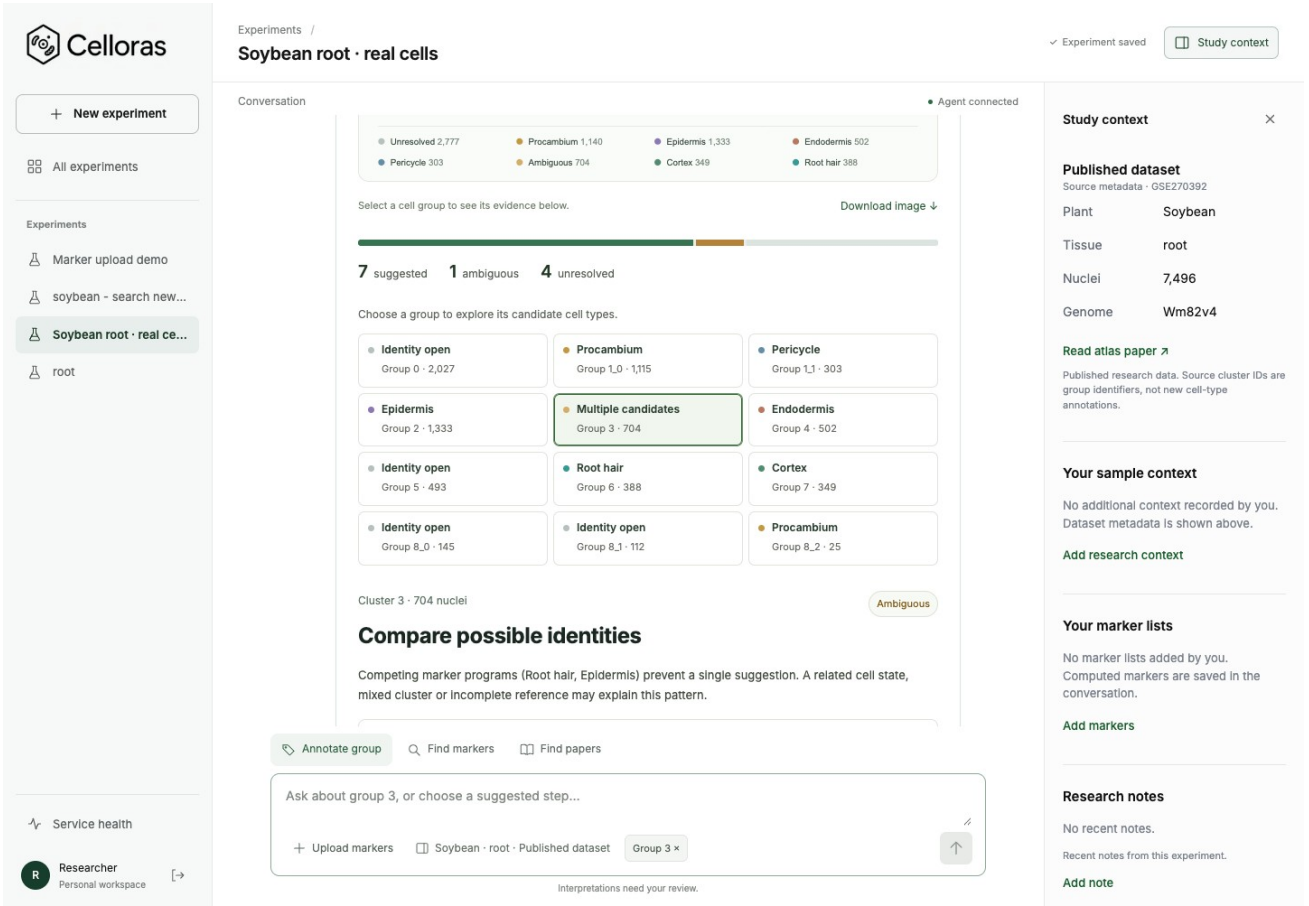

See the map, markers and sources.

3 **Review**

Save your decision and its reason.

4 **Return**

Recall the decision in a later turn.

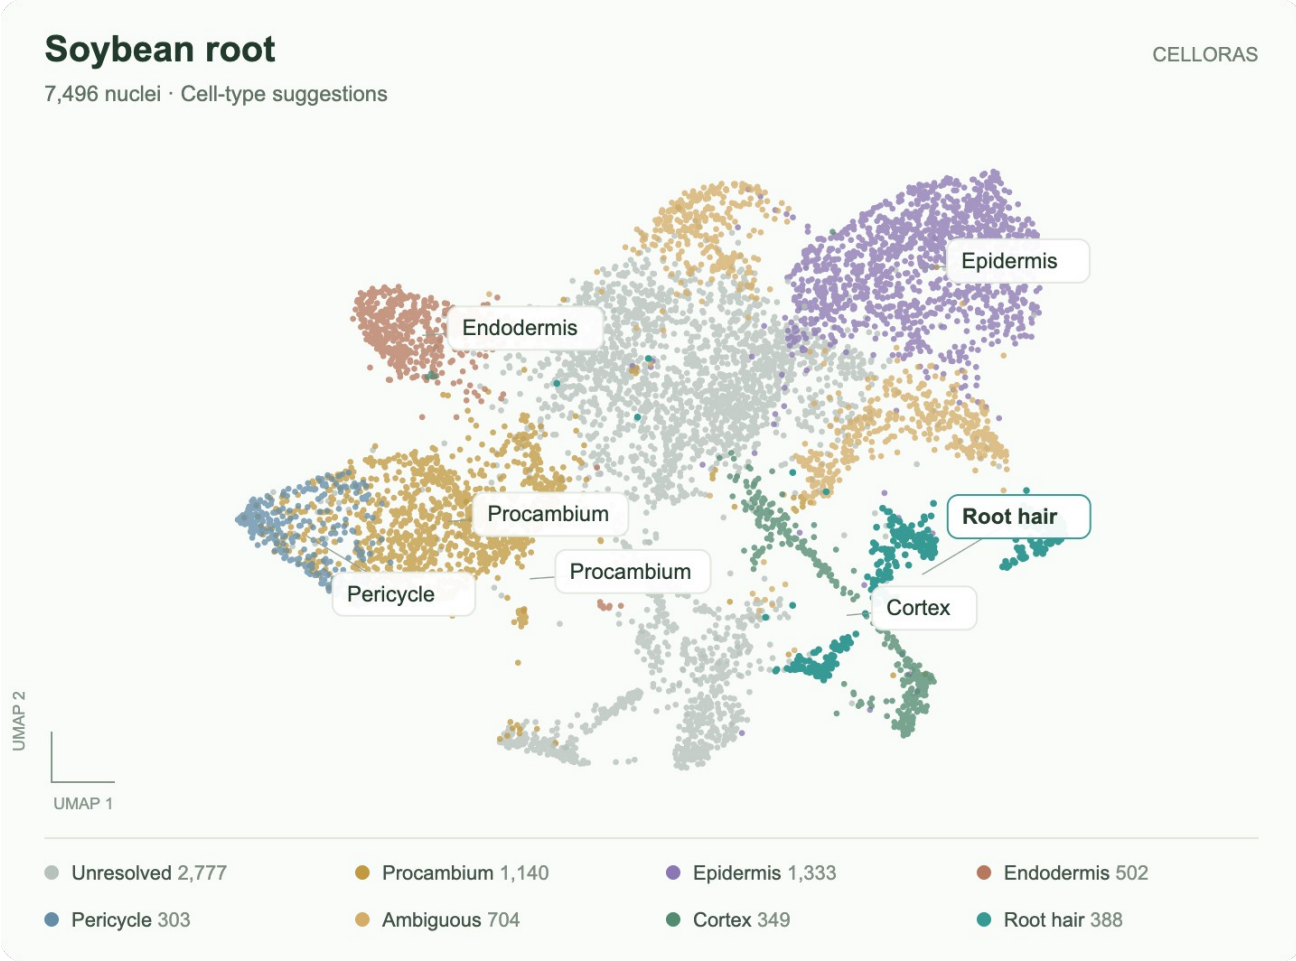

From a cell map to a question.

7,496

soybean root nuclei

12 groups

Measured gene activity.
Published map coordinates.
Visible uncertainty.

Show the genes behind the name.

Root hair

Group 6 · 388 nuclei · 2 supporting genes

Zetaris supplies the versioned marker reference.

42 published associations.
The analysis keeps the query receipt
and checks the reference version.

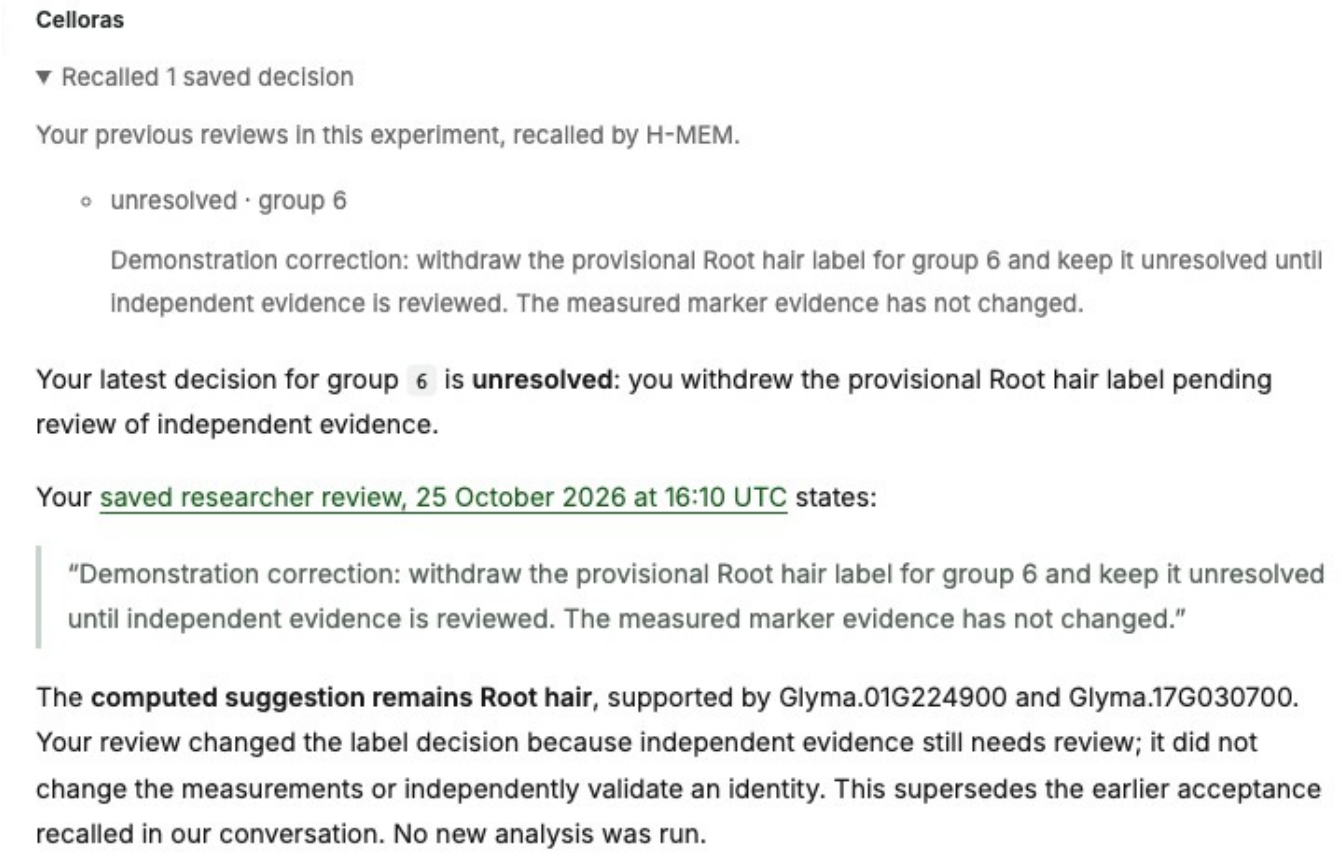

Size: fraction expressing · Color: mean expression

Remember the decision, and why.

“What did I decide about this group?”

H-MEM retrieves the latest saved review, its reason and a link to the record.

> **The researcher decides.**
> **The measurements stay intact.**

One agent. Clear responsibilities.

Workspace

Next.js + Keycloak
Project-owned conversations

Agent + tools

OpenShell / Codex worker
Measured scientific analysis

Zetaris

Versioned marker reference
Read-only query + provenance

Researcher saves an explicit review

Meterless H-MEM

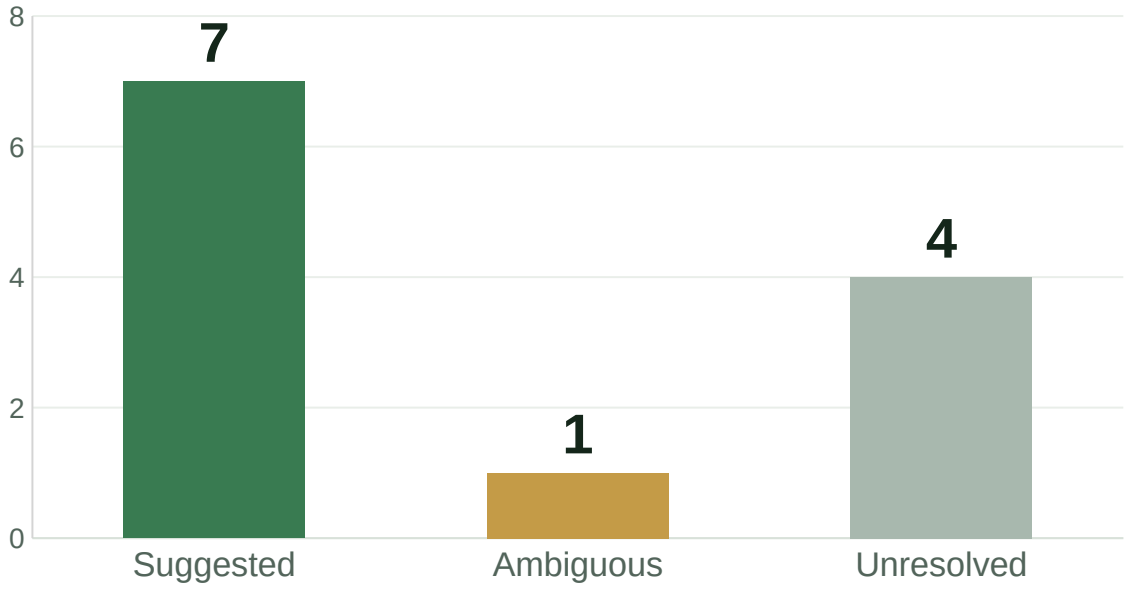

Review memory + PostgreSQL

Later question → retrieve the current review → cite its source

Provider interfaces keep models, references and memory replaceable.

A working workflow, with visible limits.

12 groups in the soybean demo

2,952

numerical comparisons passed

Independent implementation check against the actual count data.

Live sponsor workflow passed

Annotation → evidence → review → H-MEM recall and correction

These are exploratory suggestions. Independent biological validation is next.

Soybean first.
Other plants next.

01

Validate

Test against independent soybean references.

02

Bring your data

Extend the workflow to researchers' .h5ad files.

03

Add plants

Connect compatible species and marker panels.

Try the working soybean demo

celloras.com

Built from real data and working code.

01 DATA

Soybean developmental atlas

Zhang et al. · Cell · GSE270392

02 METHODS

Measured annotation and validation

Source panel, rules, tests and scope

03 WORKING DEMO

Celloras application and repository

Demo links, setup and reproducible checks

04 REQUIRED SPONSORS

Zetaris + Meterless H-MEM

Implementation details and test evidence

05 STRUCTURE REFERENCE

Airbnb’s original pitch deck

A plain problem → solution → product story

06 PROOF REFERENCE

Buffer’s original 2011 pitch deck

Concrete evidence, with little text
