Celloras

An agent for plant cell annotation.

From gene expression to candidate cell types, with the supporting evidence.

Ask a question. Get a cell map, marker evidence and source links.

Starting with soybean. More plants next.

Which cells are in this soybean root?

Thousands of gene profiles. Twelve groups to identify.

Without Celloras		With Celloras
Run the analysis scripts	→	**Upload your H5AD data**
Compare genes with references	→	**Agent proposes names + evidence**
Keep decisions across tools	→	**Review, save and ask again**

The agent analyses and recommends. You review and correct the results.

From uploaded data to a cell map

1 Upload prepared H5AD

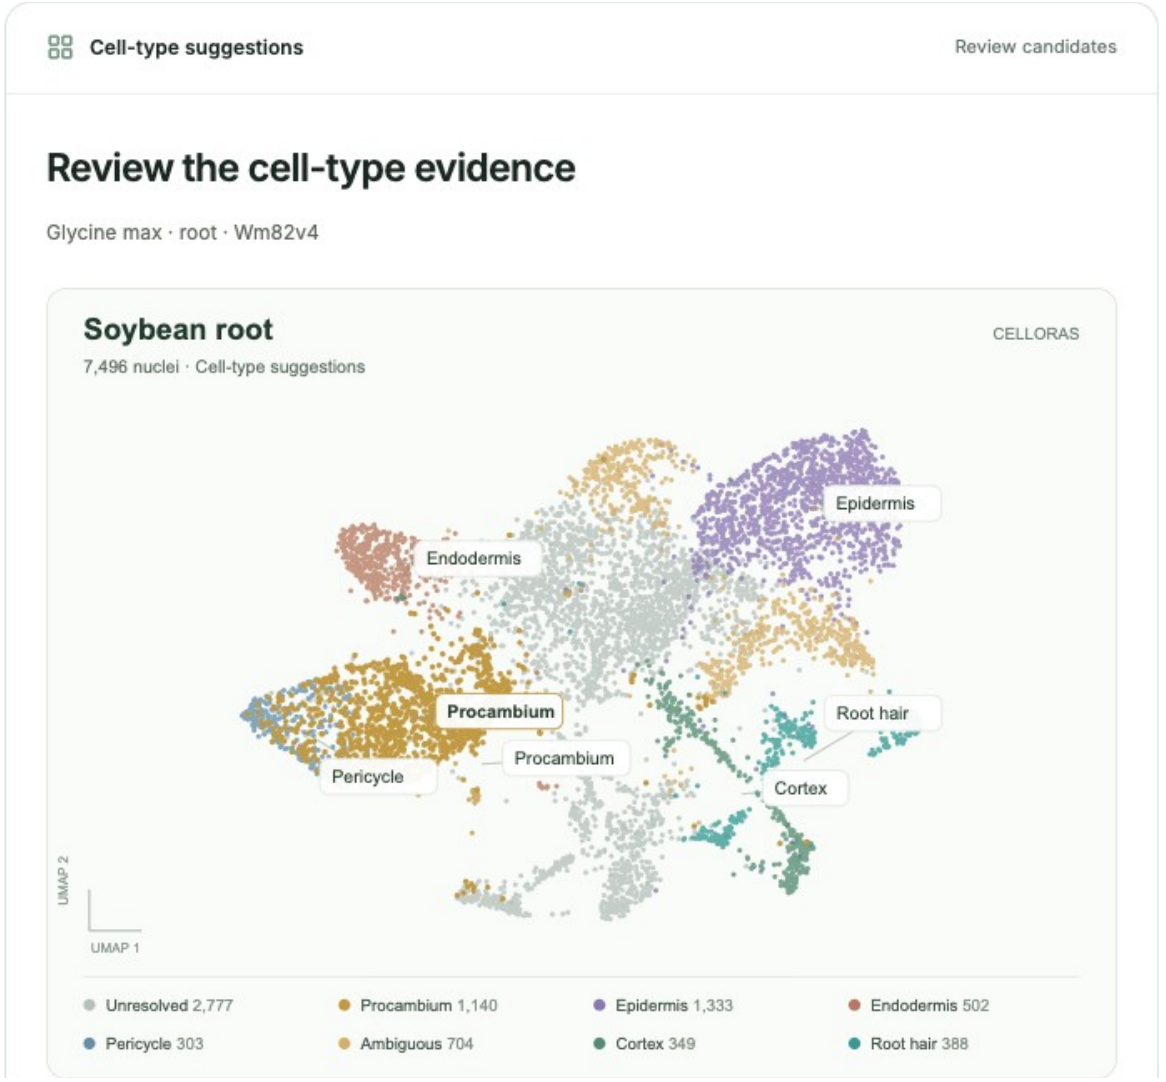

7,496 nuclei · 12 existing groups

2 Agent checks the evidence

Zetaris retrieves published markers.
Analysis tools measure gene activity.

3 Inspect the suggestion

Root hair · 388 nuclei
2 supporting genes to investigate

“What did we decide, and why?”

Meterless H-MEM recalls your reviewed decision when you ask again.

The saved review in this demo

Root hair. Keep it provisional.

The agent recalls the supporting genes and the need for independent evidence.

Open the saved review and recall

Follow the run in the activity dashboard.
